

Brass Bar

Brass bar can be sawn to your required lengths as one offs or multiple cut pieces

Brass bar stockholders and suppliers, delivering to the whole of the UK. West Yorkshire Steel are suppliers of a range of sizes and grades in brass bar. Available as round, flat and hexagon bar.

Brass is a non ferrous alloy made up of copper and zinc. The various proportions of copper and zinc combine to create different grades of brass providing various mechanical and electrical properties. Various other alloying elements are added to brass grades which offer differing characteristics.

The most common brass bar grade is CZ121 / CW614N. The addition of lead to this brass specification gives it excellent machining properties and it is commonly used for high speed machining operations or where a component requires intricate machining. Other characteristics of this grade include its good strength, resistance to corrosion and good suitability for soldering and brazing.

Other brass specifications are available conforming to British, European and international standards.

We welcome export enquiries for brass bar. Contact our sales office and consult our [shipping policy](#) for further details.
